Workers exposed to carbon disulfide frequently experience disorders of the gastrointestinal tract as well as changes in the nervous system. Functional changes in the liver (distinct lowering of the antitoxic, carbohydrate, and protein functions) usually appear early in the development of chronic carbon disulfide poisoning. An analysis of the previously derived equations for the equilibrium curves of binary systems in approximation to regular solutions, is made for a number of particular cases. It is shown that the shape of the equilibrium curves is determined by the magnitude and the ratio of the mixing in the co-existing phases. The phase diagram of the system Au-Pt is calculated and it is shown that a slight increase in the mixing energy in this system changes the diagram from the monotonic type for a mutual solubility in all proportions in liquid and solid states to one of the peritectic type.
